FaceTrack keeps each attendance decision tied to its detection and distance

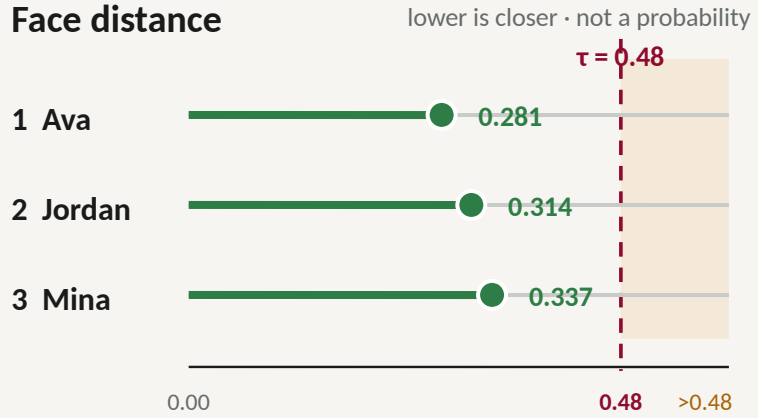

The public fixture shows every outcome; local code keeps the ledger and frame lifecycle explicit.

COMPLETE DECISION TRACE

Bundled deterministic demo · fictional classroom image · all four detections shown

DISTANCE THRESHOLD

? Detection 4 stays unknown

Outcome retained; fixture does not store its distance.

LOCAL RETENTION

Ledger	UNIQUE(name, attendance_date)
Frames	finally → delete staged files

DEMO EVIDENCE

Fictional image and deterministic values. The demo writes no attendance records.

LIVE IMPLEMENTATION

Local, consented images; one processing lock; daily SQLite deduplication; cleanup by default.

NOT CLAIMED

No recognition-accuracy study, biometric dataset, surveillance deployment, or outcome evidence.
